

Measurement-noise stress on the unstable + RHP-zero plant: nominal-screened controllers from first failure onset to the highest tested scale

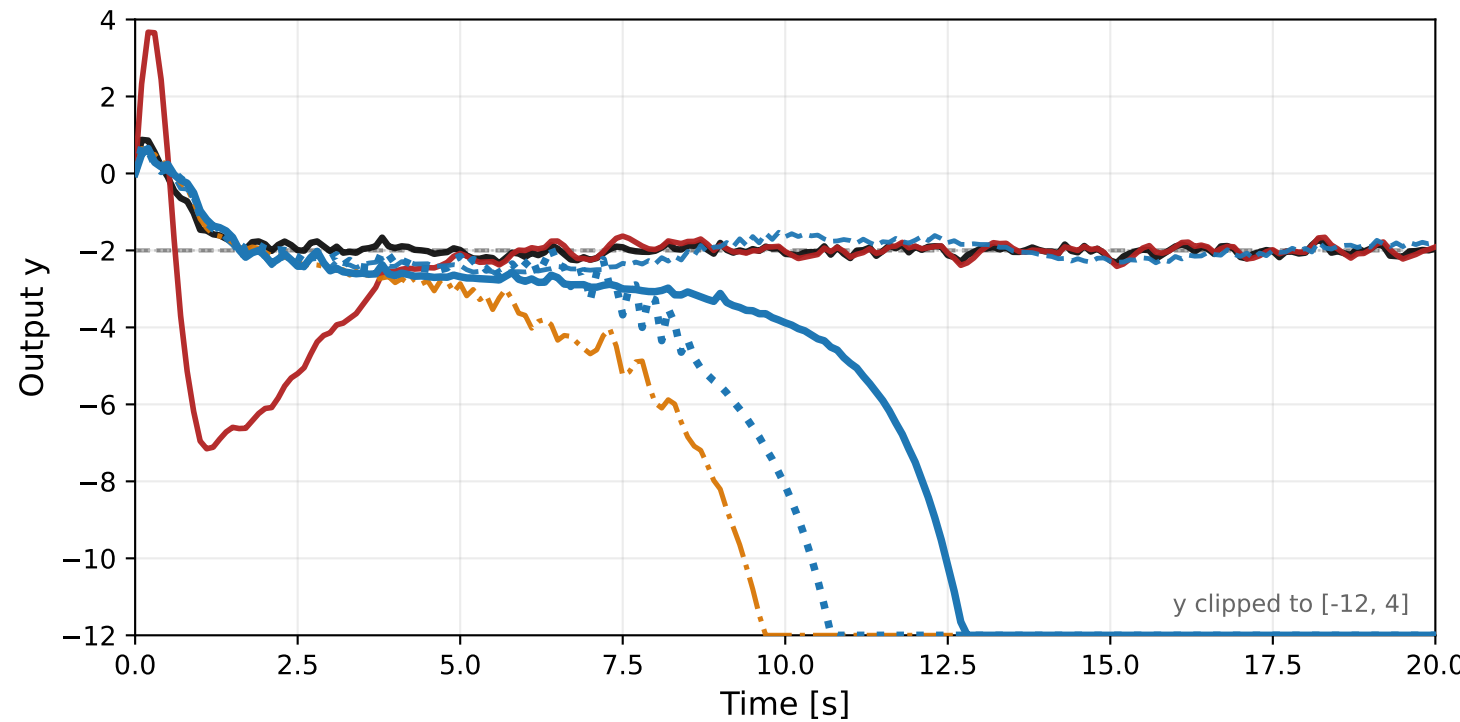

Noise scale $x = 0.1$
newly failing: $\text{MLP}_r(32,32)$

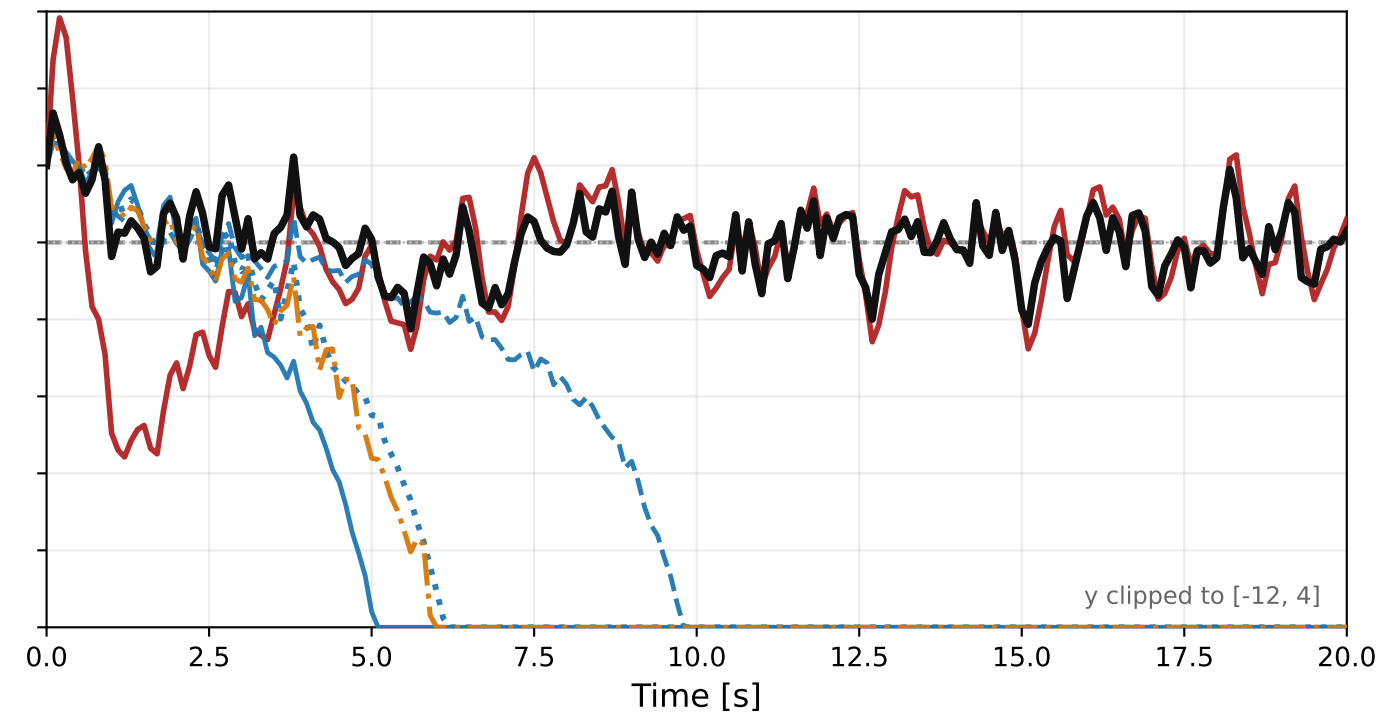

Noise scale $x = 0.8$
newly failing: $\text{MLP}_c(32,32)$

Noise scale $x = 3$
newly failing: $\text{MLP}_r(16,16)$, $\text{MLP}_r(32,32,32)$

Noise scale $x = 20$
highest tested scale; MPC still passes all plants

--- reference — RL (PID-features) — $\text{MLP}_r(32,32)$ - - $\text{MLP}_c(32,32)$
— MPC — $\text{MLP}_r(16,16)$... $\text{MLP}_r(32,32,32)$
